U3.1

Learning Objective

- Greedy Techniques
- Prim's Algorithm & Kruskal's Algorithm
- Dijkstra's and Bellman Ford Algorithm
- Huffman trees.
- Knapsack Problem
- Dynamic Programming paradigm ,
- Warshall 's and Floyd's Algorithm
- Optimal Binary Search trees & Matrix multiplication Problem ,
- 0/1 Knapsack Problem
- maximum network flow problem
- naive string matching algorithm , string matching with finite automata Knuth morris Pratt algorithm , The Rabin-Karp Algorithm.

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Shivendra Goel.

U3.2

Greedy Algorithms Cont...

Greedy Strategy

- Greedy Algorithm is a class of Algorithm which based on the strategy:-
- “GET THE BEST WHICH YOU CAN AT THAT VERY MOMENT IGNORING THE LONG TERM STRATEGIES.”

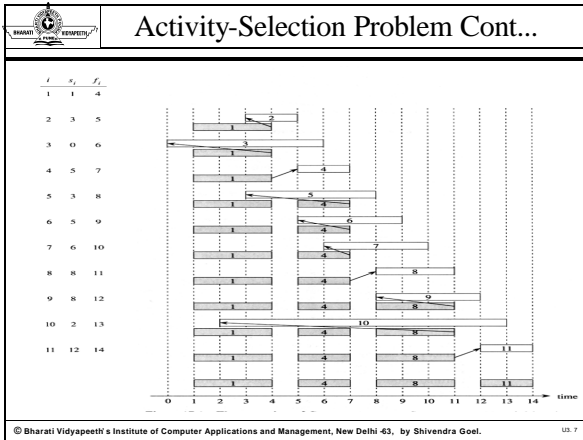

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Shivendra Goel.

U3.3

	<h2>Activity-Selection Problem</h2>
<h3>Activity-selection problem</h3>	
<ul style="list-style-type: none"> We are given a set of proposed activities $S = \{A_1, A_2, \dots, A_n\}$ that wish to use a resource, which can be used by only one activity at a time. Each activity is defined by a pair consisting of a start time s_i and a finish time f_i, 	
<small>© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Shivendra Goel. U3.4</small>	

	<h2>Activity-Selection Problem Cont...</h2>
<p>1. with $0 \leq s_i < f_i < \text{infinity}$. If selected, activity A_i takes place during the time interval $[s_i, f_i]$. Two activities A_i and A_j are compatible if $s_i \geq f_j$ or $s_j \geq f_i$. The activity-selection problem is to select the maximum number of mutually compatible activities.</p>

Dynamic Programming

Dynamic Programming is a technique used for algorithm Design this technique is useful for designing algorithm for optimization Problems.

Dynamic Programming can be divided into four steps

- 1) Characterization of suboptimal problems.
- 2) Recursively define the solution to the sub optimal problems.

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-43, by Shivendra Goel. U3.8

Dynamic Programming Cont...

- 3) To compute an optimal solution for one of the sub optimal problems.
- 4) To combine the solutions for the suboptimal problems to reach the solution of the given problem.

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-43, by Shivendra Goel. U3.9

	<h2>Dynamic Programming Cont...</h2>
<h3>Elements of Dynamic Programming</h3> <ul style="list-style-type: none"> • Optimal Substructure :- Under this approach identify a optimal substructure on which entire problem is based. • Overlapping substructure :-The problem is solved by same sub problem over and over rather than always generating new sub problems. • Memoization:- It maintains an entry in a table for the solution of each sub problem. 	
<small>© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-43. by Shivendra Goel. 18 10</small>	

	<h2>Matrix-Chain Multiplication</h2>
<ul style="list-style-type: none"> • An example problem to be solved with DP: • Matrix-chain multiplication: • $\langle A_1, A_2, A_3, \dots, A_n \rangle$, n matrices to be multiplied together. $A \quad x \quad B \quad = \quad C$ $(p \times q) * (q \times r) = (p \times r)$ • Grouping matters: We define the order of performing our multiplications by grouping using parenthesis. 	
<small>© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-43. by Shivendra Goel. 18 11</small>	

	<h2>Matrix-Chain Multiplication Cont...</h2>
<ul style="list-style-type: none"> • $\langle A_1, A_2, A_3, A_4 \rangle$ 1. $(A_1 (A_2 (A_3 A_4)))$ 2. $(A_1 ((A_2 A_3) A_4))$ 3. $((A_1 A_2) (A_3 A_4))$ 4. $((A_1 (A_2 A_3)) A_4)$ 5. $((A_1 A_2) A_3) A_4)$ • Five possible parenthesizations of four matrices. 	
<small>© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63. By Shivendra Goel. 18 12</small>	

	Matrix-Chain Multiplication Cont...
<ul style="list-style-type: none"> • How much can different parenthesizations cost? • $\langle A_1, A_2, A_3 \rangle$ • $A_1 : 10 \times 100$ • $A_2 : 100 \times 5$ • $A_3 : 5 \times 50$ 	
<small>© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-43. by Shivendra Goel. 18 13</small>	

	Matrix-Chain Multiplication Cont...
<ul style="list-style-type: none"> • $((A_1 A_2) A_3)$ • $(A_1 A_2) : 10 \times 100 \times 5 = 5000$ • $((A_1 A_2) A_3) : 10 \times 5 \times 50 = 2500$ 7500 multiplications • $(A_1 (A_2 A_3))$ • $(A_2 A_3) : 100 \times 5 \times 50 = 25000$ • $(A_1 (A_2 A_3)) : 10 \times 100 \times 50 = 50000$ 75000 multiplications 	
<small>© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-43. by Shivendra Goel. 18 14</small>	

	Matrix-Chain Multiplication Cont...
<ul style="list-style-type: none"> • Matrix-Chain multiplication problem can be stated as follows: Given a chain of $\langle A_1, A_2, A_3, \dots, A_n \rangle$ of n matrices, where $i=1,2,3,\dots,n$. matrix A_i has dimension $P_{i-1} \times P_i$, fully parenthesize the product $A_1 A_2 A_3 \dots A_n$ in a way that minimizes the number of multiplications. Our main goal is only to determine an order for multiplying matrices that has the lowest cost. 	
<small>© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-43. by Shivendra Goel. 18 15</small>	

	Matrix-Chain Multiplication Cont...
<p> $A_{1..n} = A_1 A_{i+1} \dots A_n$ To parenthesize we first pick k: $A_{1..k} A_{k+1..n}$ Cost of this parenthesization is a. $A_{1..k}$ b. $A_{k+1..n}$ c. multiplying the two parts together. </p>	
<small>© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-43, by Shivendra Goel. 18 16</small>	

	Matrix-Chain Multiplication Cont...
<ul style="list-style-type: none"> Let us assume that the optimal parenthesization splits the product $A_1 A_{i+1} A_{i+2} \dots A_j$ between A_k and A_{k+1} where $i \leq k < j$. Then $m[i,j]$ is equal to minimum cost for computing the sub products $A_{1..k}$ and $A_{k+1..j}$. Plus cost of multiplying these two matrices together. Each matrix A_i is $p_{i-1} p_i$. So to compute the matrix product $A_{1..k}$ and of $A_{k+1..j}$ takes $p_{i-1} p_k p_j$ 	
<small>© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-43, by Shivendra Goel. 18 17</small>	

	Matrix-Chain Multiplication Cont...
<p> $m[i,j] = 0$ if $i = j$, and: $m[i,j] = \min_{i \leq k < j} \{ m[i,k] + m[k+1,j] + p_{i-1} p_k p_j \}$ So we can construct the optimal solution we also define: $s[i,j] = k$ that produces the minimum. </p>	
<small>© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-43, by Shivendra Goel. 18 18</small>	

	<h2>Matrix-Chain Multiplication Cont...</h2>
<p> $A1=10 \times 5$ $A2=5 \times 3$ $A3=30 \times 20$ $A4=20 \times 15$ </p>	
<small>© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Shivendra Goel. 18 19</small>	

	<h2>Optimal Binary Search Tree</h2>
<ul style="list-style-type: none"> In representation of BST there are various variation in representing a BST with that much number of nodes, Optimal BST is the one which has lowest search cost. 	
<small>© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Shivendra Goel. 18 20</small>	

	<h2>Optimal Binary Search Tree Cont...</h2>
<p> $? p_i + ? q_i - 1$ search cost $k_i = (\text{dept} + 1) * p_i$ search cost $d_i = (\text{dept} + 1) * q_i$ total search cost = search cost ? k_i + search cost ? d_i </p>
