

## Unit -3

# Transformation, Clipping, Projections and Solid Modeling

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Vaishali Joshi, Assistant Professor. U3.1

---

---

---

---

---

---

---

---

## Learning Objective

**Transformations**  
2-D Viewing Transformation, Computing location of Viewport, Window-to-viewport transformation

**Clipping**  
Line Clipping; Sutherland Cohen clipping algorithms, Sutherland-Hodgeman

**Projection**  
Parallel and Perspective Projections

**Solid Modeling**  
Sweeping a polygon or a surface patch along a path to form solids, Boundary Representation (B-Rep), octrees, CSG – Constructive Solid Geometry.

---

---

---

---

---

## Two-Dimensional Viewing

2-D viewing is the formal mechanism for displaying views of a picture on an output device. Terms related to 2-D viewing are :

- Co-ordinate representations
- Output primitive
- Attributes
- Transformations
  - Geometric
  - Modeling
  - Viewing
- Structures/ Segments/ Objects

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Vaishali Joshi, Assistant Professor U3. #

---

---

---

---

---

---

---

---

## Two-Dimensional Viewing

- Co-ordinate representations
- Output primitive
- Attributes
- Transformations
  - Geometric
  - Modeling
  - Viewing
- Structures/ Segments/ Objects

---

---

---

---

---

---

---

---

## Co-ordinate Representations

- Modeling coordinates
- World coordinates
- Viewing coordinates
- Normalized viewing coordinates
- Device coordinates

$(X_{mc}, Y_{mc}) \rightarrow (X_{wc}, Y_{wc}) \rightarrow (X_{vc}, Y_{vc}) \rightarrow (X_{nvc}, Y_{nvc}) \rightarrow (X_{dc}, Y_{dc})$

---

---

## Window-to-Viewport transformation

- **Window**
  - World coordinate area selected for display
  - It defines what is to be displayed
- **Viewport**
  - An area on a display device to which a window is mapped
  - It defines where it is to be displayed

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Vaishali Joshi, Assistant Professor U3. #

---

---

---

---

---

---

---

---

## Window-to-Viewport transformation

- Transform 2D Geometric Primitives from Scene Coordinate System (World Coordinates) to Image Coordinate System (Device Coordinates)
- When we are interested in displaying certain portions of the drawing, *windowing* technique is used
- *Viewing transformation* is the mapping of a part of a world-coordinate scene to device coordinates.
- 2D (two dimensional) viewing transformation sometimes referred to as the *window-to-viewport transformation* or the *windowing transformation*.

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Vaishali Joshi, Assistant Professor U3. #

---

---

---

---

---

---

---

---

### Viewport Transformation Cont..

- Mapping a window onto a viewport involves converting from one coordinate system to another.
- Zooming effects can be achieved by successively mapping different-sized windows on a fixed-size viewport.
- Panning effects are produced by moving a fixed-size window across various sized viewport.

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Vaishali Joshi, Assistant Professor U3. #

---

---

---

---

---

---

---

---

### Window-to-Viewport transformation

- The mapping of a part of world co-ordinate scene to device coordinates is referred to as viewing transformation.
- A viewing transformation uses standard rectangles for the window and viewport

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Vaishali Joshi, Assistant Professor U3. #

---

---

---

---

---

---

---

---

### Window-to-Viewport transformation

- Setting up a rotated world window in viewing coordinates and the corresponding normalized-coordinate viewport

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Vaishali Joshi, Assistant Professor U3. #

---

---

---

---

---

---

---

---

### Viewing Coordinate Reference Frame

- Used to provide a method for setting up arbitrary orientations for rectangular windows
- Matrix for converting world-coordinate positions to viewing coordinate  

$$\mathbf{M}_{wc,vc} = \mathbf{R} \cdot \mathbf{T}$$

**R: rotation matrix**  
**T: translation matrix**

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Vaishali Joshi, Assistant Professor U3. 6

---

---

---

---

---

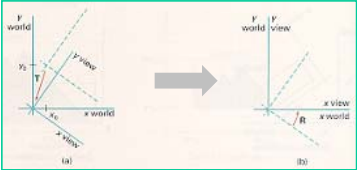

---

---

---

### Viewing Coordinate Reference Frame

- The steps in this coordinate transformation
  - A viewing coordinate frame is moved to coincidence with the world frame in two steps
    - Translate the viewing origin to the world origin, then
    - Rotate to align the axes of the two systems

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Vaishali Joshi, Assistant Professor U3. 6

---

---

---

---

---

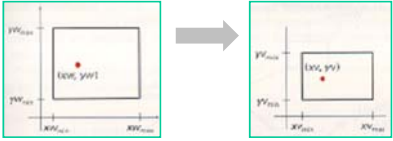

---

---

---

### Window-to-Viewport transformation cont..

- Window-to-viewport mapping
  - A point at position (xw, yw) in a designated window is mapped to viewport coordinates (xv, yv) so that relative positions in the two areas are the same

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Vaishali Joshi, Assistant Professor U3. 6

---

---

---

---

---

---

---

---

**Window-to-Viewport transformation cont..**

$$\frac{xv - xv_{min}}{xv_{max} - xv_{min}} = \frac{xw - xw_{min}}{xw_{max} - xw_{min}}$$

$$\frac{yv - yv_{min}}{yv_{max} - yv_{min}} = \frac{yw - yw_{min}}{yw_{max} - yw_{min}}$$

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Vaishali Joshi, Assistant Professor U3. #

---

---

---

---

---

---

---

---

**Window-to-Viewport transformation cont..**

From these two equations we derived

$$xv = xv_{min} + (xw - xw_{min})sx$$

$$yv = yv_{min} + (yw - yw_{min})sy$$

where the scaling factors are

$$sx = \frac{xv_{max} - xv_{min}}{xw_{max} - xw_{min}} \quad sy = \frac{yv_{max} - yv_{min}}{yw_{max} - yw_{min}}$$

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Vaishali Joshi, Assistant Professor U3. #

---

---

---

---

---

---

---

---

**Window-to-Viewport transformation cont..**

Thus, the conversion of window area into viewport area is performed with the following sequence of transformations:

1. Perform a scaling that scales the window area to the size of the viewport.
2. Translate the scaled window area to the position of the viewport.
3. Relative proportions are maintained if the scaling factors are same ( $sx=sy$ )

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Vaishali Joshi, Assistant Professor U3. #

---

---

---

---

---

---

---

---

**Window-to-Viewport transformation cont..**

- The way of character string mapping
  - Maintaining character size
    - ✓ Using standard character fonts
  - Changing character size
    - ✓ Using characters formed with line segments
- Workstation transformation
  - Opening any number of output devices in a particular application
  - Performing another window-to-viewport transformation for each open output device

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Vaishali Joshi, Assistant Professor U3. 48

---

---

---

---

---

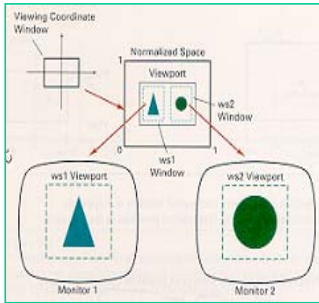

---

---

---

**Window-to-Viewport transformation cont..**

- Mapping selected parts of a scene in normalized coordinates to different video monitors with Workstation transformation

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Vaishali Joshi, Assistant Professor U3. 49

---

---

---

---

---

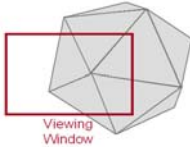

---

---

---

**Clipping**

- Any procedure that identifies those portions of a picture that are either inside or outside of a specified region of space is called **clipping**
- The region against which an object is clipped is called a **clip window** or **viewing window**
- Avoid Drawing Parts of Primitives Outside Window
  - Window defines part of scene being viewed
  - Must draw geometric primitives only inside window

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Vaishali Joshi, Assistant Professor U3. 50

---

---

---

---

---

---

---

---

## Clipping

- Clipping algorithms can be considered for following primitive types
  - Point
  - Line
  - Area (polygons)

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Vaishali Joshi, Assistant Professor U3. #

---

---

---

---

---

---

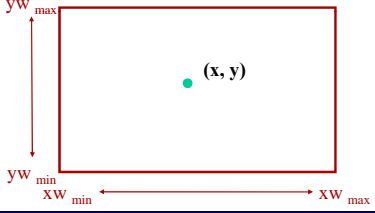

---

---

## Point Clipping

- Assuming that the clip window is a rectangle in standard position
- Saving a point  $P=(x, y)$  for display
 

Inside =  
 $xw_{min} \leq x \leq xw_{max}$   
 $yw_{min} \leq y \leq yw_{max}$
- Applying Fields
  - Particles (explosion, sea foam)

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Vaishali Joshi, Assistant Professor U3. #

---

---

---

---

---

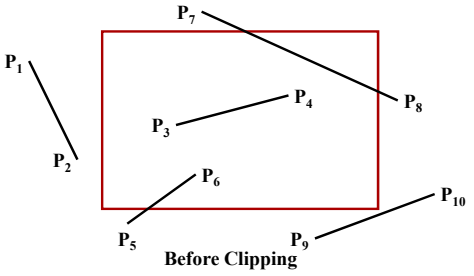

---

---

---

## Line Clipping

- Find the Part of a Line Inside the Clip Window

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Vaishali Joshi, Assistant Professor U3. #

---

---

---

---

---

---

---

---

### Line Clipping

---

---

---

---

---

---

---

### Cohen-Sutherland Line Clipping

**Line Clipping**

- Split plane into 9 regions
- Assign each a 4-bit tag (left, right, below, above)
- Assign each endpoint a tag

1001	1000	1010
0001	0000	0010
0101	0100	0110

clip rectangle

---

---

---

---

---

---

---

---

### Cohen-Sutherland Line Clipping

**Sutherland Cohen clipping algorithms**

**Checking for trivial acceptance or rejection using outcodes**

- Each endpoint of a line segment is assigned an outcode;
- If both 4-bit codes are zero, the line can be accepted;
- A logical **and** is performed on both outcodes;
- If the result is nonzero, the line can be rejected.
- Else If not accepted or rejected, divide the line segment into two at a clip edge
- Iteratively clipped by test acceptance or rejection, and divided into two segments until completely inside or rejection.

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Vaishali Joshi, Assistant Professor U3. #

---

---

---

---

---

---

---

---

### Cohen-Sutherland Line Clipping

Which Line is accepted or rejected or clipped

- $G = 1001$ ,  $H = 1000$
- $I = 0001$ ,  $J = 1000$
- $A = 0000$ ,  $B = 0000$
- $C = 0000$ ,  $B = 0010$
- $E = 0100$ ,  $F = 0100$

### Cohen-Sutherland Line Clipping

Intersection points with a clipping boundary :

$$x = x_1 + \frac{(y - y_1)}{m}$$

$$y = y_1 + m(x - x_1)$$

Where  $x$  = either  $x_{w_{min}}$  or  $x_{w_{max}}$   
 $y$  = either  $y_{w_{min}}$  or  $y_{w_{max}}$   
 $m = (y_2 - y_1) / (x_2 - x_1)$

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Vaishali Joshi, Assistant Professor U3. #

---

---

---

---

---

---

---

---

### Polygon Clipping

#### Sutherland-Hodgman Clipping Algorithm

- To clip an area against an individual boundary:
  - Consider each vertex in turn against the boundary
  - Vertices inside the boundary are saved for clipping against the next boundary
  - Vertices outside the boundary are clipped
  - If we proceed from a point inside the boundary to one outside, the intersection of the line with the boundary is saved
  - If we cross from the outside to the inside intersection point and the vertex are saved

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Vaishali Joshi, Assistant Professor U3. #

---

---

---

---

---

---

---

---

### Polygon Clipping

- Each example shows the point being processed (P) and the previous point (S)
- Saved points define area clipped to the boundary in question

Save Point P      Save Point I

No Points Saved      Save Points J & P

## Orthographic and Oblique

- Orthographic parallel projection
  - the projection is perpendicular to the view plane

- Oblique parallel projection
  - The projectors are inclined with respect to the view plane

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Vaishali Joshi, Assistant Professor U3. #

---

---

---

---

---

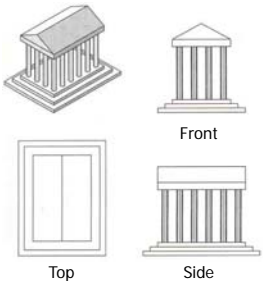

---

---

---

## Orthographic Projections

- DOP perpendicular to view plane

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Vaishali Joshi, Assistant Professor U3. #

---

---

---

---

---

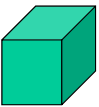

---

---

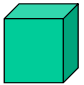

---

## Oblique Projections

- DOP not perpendicular to view plane

Cavalier  
(DOP at  $45^\circ$ )

---

---

---

---

---

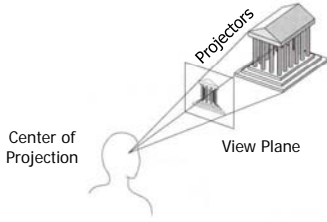

---

---

---

### Perspective Projection

- Map points onto "view plane" along "projectors" emanating from "center of projection"(cop)

Center of Projection      View Plane

Projectors

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Vaishali Joshi, Assistant Professor U3. #

---

---

---

---

---

---

---

---

### Perspective Projection

- Used for:
  - Human visual system...
- Pros:
  - gives a realistic view and feeling for 3D form of object
- Cons:
  - does not preserve shape of object or scale
- Different from a parallel projection because
  - parallel lines not parallel to the projection plane converge
  - size of object is diminished with distance
  - foreshortening is not uniform

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Vaishali Joshi, Assistant Professor U3. #

---

---

---

---

---

---

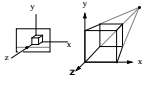

---

---

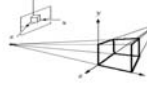

### Perspective Projection

What is vanishing point?

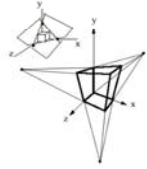

- A vanishing point is where parallel lines that move off into the distance seem to converge.
- In computer graphics, lines extending from edges converge to common vanishing point(s)

**One Point Perspective**  
(z-axis vanishing point)

**Two Point Perspective**  
(z, and x-axis vanishing points)

**Three Point Perspective**  
(z, x, and y-axis vanishing points)

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Vaishali Joshi, Assistant Professor U3. #

---

---

---

---

---

---

---

---

---

---

---

## Perspective vs. Parallel

- Perspective projection
  - + Size varies inversely with distance – looks realistic
  - Distance and angles are not (in general) preserved
  - Parallel lines do not (in general) remain parallel
- Parallel projection
  - + Good for exact measurements
  - + Parallel lines remain parallel
  - Angles are not (in general) preserved
  - Less realistic looking

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Vaishali Joshi, Assistant Professor U3. #

---

---

---

---

---

---

---

## Solid Modeling

- It is a mathematical technique for representing solid objects in terms of basic output primitives and splines.
- Representation of solids can be done in following ways :
  - Sweep representations
  - Boundary representations (B-Reps)
  - Space-partitioning representations (Octrees, BSP trees)
  - Constructive Solid Geometry (CSG)

## Solid Modeling

### Sweep Representations

- Sweep representations are useful for constructing 3-D objects that possess translational or rotational symmetries.
- A large class of shapes can be formed by *sweeping* a 2D shape through space.
- Sweeps can be :
  - Translational
  - Rotational

---

## Solid Modeling Cont..

### Boundary Representation (B-Rep)

- A solid is modeled as a set of surfaces forming its boundary.
- These surfaces separate object interior from environment.
- Example : Polygon facets

### Topology and Geometry

1. Topology – how the surfaces are connected together.
2. Geometry – where the surfaces actually are in space.
3. Topology and Geometry are strongly linked.

---

---

---

---

---

---

---

## Solid Modeling Cont..

- The most commonly used boundary representation for a 3-D graphics object is a set of surface polygons that enclose the object interior.
- All surfaces are described with linear equations.
- There are different ways for describing a Polygon Surface :
  - Polygon tables (vertex, edge and polygon-surface table)
  - Plane Equation
  - Polygon meshes (triangle strip, quadrilateral mesh)

**Solid Modeling Cont..**

**Binary Space Partitions (BSPs)**

- Recursive Partition of Space by Planes
  - Mark leaf cells as inside or outside object

The diagram illustrates the process of Binary Space Partitions (BSPs). It consists of three parts:
 

- Object:** A polygon with vertices labeled a, b, c, d, e, f, g.
- Binary Spatial Partition:** The object is partitioned by three planes (1, 2, 3) into seven regions labeled a, b, c, d, e, f, g. Plane 1 is the top boundary, plane 2 is the bottom boundary, and plane 3 is a vertical line passing through the object.
- BSP Tree:** A tree structure where each node is a square containing a letter and a number. The root node is 'a' with '1'. It has two children: 'b' with '2' (left) and '1' (right). Node 'b' has two children: 'c' with '3' (left) and '2' (right). Node 'c' has two children: 'd' with '4' (left) and '3' (right). Node 'd' has two children: 'e' with '5' (left) and '4' (right). Node 'e' has two children: 'f' with '6' (left) and '5' (right). Node 'f' has two children: 'g' with '7' (left) and '6' (right).

**Solid Modeling Cont..**

**Quadtree and Octrees:**

- A *quadtree* is a tree in which each node has at most 4 children.
- An *octree* is a tree in which each node has at most 8 children.

---

---

---

---

---

---

---

---

**Solid Modeling Cont..**

In practice, however, we use "quadtree" and "octree" to mean something more specific:

- Each node of the tree corresponds to a square (quadtree) or cubical (octree) region.
- If a node has children, think of its region being chopped into 4 (quadtree) or 8 (octree) equal subregions. Child nodes correspond to these smaller subregions of their parent's region.
- Subdivide as little or as much as is necessary.
- Each internal node has exactly 4 (quadtree) or 8 (octree) children.

**Solid Modeling Cont..**

- Constructive Solid Geometry (CSG)
- Represent solid object as hierarchy of boolean operations
  - Union
  - Difference
  - Intersection

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Vaishali Joshi, Assistant Professor U3. #

---

---

---

---

---

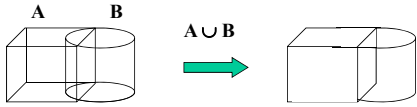

---

---

---

**Solid Modeling Cont..**

- Union
  - The sum of all points in each of two defined sets. (logical "OR")
  - Also referred to as Add, Combine, Join, Merge

## Conclusion

In this unit we understand the various features like Vanishing point projection, Viewing and window to viewport transformation and various concepts of clipping and Solid modeling as well.

---

---

## Review Questions cont..

### Short answer type Questions

1. Define Vanishing Point.
2. What do you mean by aspect ratio? Give its significance.
3. Define a viewport.
4. Explain with the help of an example Window-to-viewport transformation.
5. What do you mean by Quad tree? Explain with an example.
6. Define Clipping with reference to Computer Graphics.

© Bharati Vidyapeeth's Institute of Computer Applications and Management, New Delhi-63, by Vaishali Joshi, Assistant Professor U3. #

---

---

---

---

---

---

---

---

## Review Questions cont..

### Long answer type Questions

1. What do you mean by Solid modeling? Explain various aspects of Solid modeling with example.
2. Explain Sutherland-Hodgman Clipping Algorithm? With the help of an example.
3. Explain Sutherland Cohen clipping algorithms? With the help of an example.
4. Differentiate between parallel and perspective projection.
5. Differentiate between Quad tree and Octree methods?
